**Statement for Linked Answer Questions 57 and 58:**

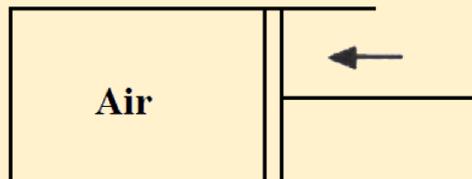

Air enters the combustor of a gas-turbine engine at a total temperature  $T_0$  of 500 K. The air stream is split into two parts: primary and secondary streams. The primary stream reacts with fuel supplied at a fuel-air ratio of 0.05. The resulting combustion products are then mixed with the secondary air stream to obtain gas with total temperature of 1550 K at the turbine inlet. The fuel has a heating value of 42 MJ/kg. The specific heats of air and combustion products are taken as  $c_p = 1 \text{ kJ/kg/K}$ .

57. If the sensible enthalpy of fuel is neglected, the temperature of combustion products from the reaction of primary air stream with fuel is approximately
- (A) 2100 K
  - (B) 3200 K
  - (C) 2600 K
  - (D) 1800 K

58. The approximate ratio of mass flow rates of the primary air stream to the secondary air stream required to achieve the turbine inlet total temperature of 1550 K is
- (A) 2:1
  - (B) 1:2
  - (C) 1:1.5
  - (D) 1:1

**Statement for Linked Answer Questions 59 and 60:**

A piston compresses 1 kg of air inside a cylinder as shown

The rate at which the piston does work on the air is 3000 W. At the same time, heat is being lost through the walls of the cylinder at a rate of 847.5 W.

59. After 10 seconds, the change in specific internal energy of the air is
- (A) 21,525 J/kg
  - (B) -21,525 J/kg
  - (C) 30,000 J/kg
  - (D) -8,475 J/kg
60. Given that the specific heats of air at constant pressure and volume are  $c_p = 1004.5$  J/kg-K and  $c_v = 717.5$  J/kg-K respectively, the corresponding change in the temperature of the air is
- (A) 21.4 K
  - (B) -21.4 K
  - (C) 30 K
  - (D) -30 K
